Summary

Initial results from a recent international research study demonstrate that Floatation REST therapy can help sufferers of Fibromyalgia relax, manage pain and attend to tasks which normally cause them difficulty.

Twenty-three volunteers completed a total of three one-hour floatation sessions, which were held five to seven days apart. Almost all of the volunteers were women aged 30 to 62.

The patients were asked to self report on a number of measures related to emotional and physical well-being. Directly before and after each session, patients used a ten point scale to indicate their levels of stress, pain, muscle tension, movement, energy, well-being, relaxation, sadness and anxiety. On average there were significant changes in all patient-reported levels, and in the direction expected, though the magnitude of these changes varied.

Across floatation sessions, decreases in muscle tension and pain were evident. For both variables, patients indicated a 25% reduction in the first session and a 33% reduction in the third session. Pain relief lasted an average of 2.5 days, and in the small sample (n=8) of patients who completed all trials and provided duration scores, the average progression was 1.9 days, 2.5 days and 3.2 days in order of floats. Statistical analysis revealed that during all floats the patient's level of relaxation increased 30% on average and levels of stress decreased 30%.

About Fibromyalgia

Fibromyalgia is a syndrome characterized by chronic pain and soreness in muscles,

-30% stress
 Patients reported an average 30% drop in stress levels after each float session.

2.5 days of pain relief
 The average duration of pain relief reported after a float. The duration appears to increase with each float session.

Fibromyalgia patients experience immediate and cumulative benefits from floating. Floatation REST relaxes the patient and provides relief to tender "trigger points" located throughout the body.

tendons and other connective tissue. It affects millions of people worldwide, and it is treatable but not known to be curable.

About Floatation Therapy

Floatation REST, which stands for Reduced Environmental Stimulus Therapy, involves the use of a specially designed floatation tank, pool or room. The patient floats on his or her back in a shallow body of water highly saturated with Magnesium Sulphate (Epsom salt), a mineral compound known for its benefits to health. The patient remains calmly buoyant in an environment of reduced light, sound, touch and other sensory input. Floatation sessions generally last about an hour and cost about the same as a massage.
